Java™ IDL is a technology for distributed objects – that is, objects interacting on different platforms across a network. Java IDL enables objects to interact regardless of whether they're written in the Java programming language or another language such as C, C++, COBOL, or others. This is possible because Java IDL is based on the Common Object Request Brokerage Architecture (CORBA), an industry-standard distributed object model.

Getting Started with Java IDL - Oracle

Java IDL (CORBA) Java IDL technology adds CORBA (Common Object Request Broker Architecture) capability to the Java platform, providing standards-based interoperability and connectivity. Java IDL enables distributed Web-enabled Java applications to transparently invoke operations on remote network services using the industry standard IDL (Object Management Group Interface Definition Language) and IIOP (Internet Inter-ORB Protocol) defined by the Object Management Group.

Java IDL-related APIs and Developer Guides

Starting with J2SE 1.4, Java IDL includes a Portable Object Adapter (POA), Object Request Broker Daemon (ORBD), and the server tool. These features enable persistent object servers to be written using Java IDL! By contrast, a transient CORBA object has the same lifetime as the execution of the server process that creates it. When a server terminates, its transient objects disappear with it and any object references held by the client become invalid.

The Java-to-IDL mapping specification defines how an IDL is derived from a Java remote interface. In the WebLogic RMI over IIOP implementation, you run the implementation class through the WebLogic RMI compiler or WebLogic EJB compiler with the -idloption. This process creates an IDL equivalent of the remote interface.
